5.3 DISCOVERY PROJECT: AREA FUNCTIONS

This project can be completed anytime after you have studied Section 5.3 in the textbook.

- I. (a) Draw the line y = 2t + 1 and use geometry to find the area under this line, above the *t*-axis, and between the vertical lines t = 1 and t = 3.
 - (b) If x > 1, let A(x) be the area of the region that lies under the line y = 2t + 1 between t = 1 and t = x. Sketch this region and use geometry to find an expression for A(x).
 - (c) Differentiate the area function A(x). What do you notice?
- 2. (a) If $0 \le x \le \pi$, let $A(x) = \int_0^x \sin t \, dt$. A(x) represents the area of a region. Sketch that region.
 - (b) Use the Evaluation Theorem to find an expression for A(x).
 - (c) Find A'(x). What do you notice?
 - (d) If x is any number between 0 and π and h is a small positive number, then A(x + h) A(x) represents the area of a region. Describe and sketch the region.
 - (e) Draw a rectangle that approximates the region in part (d). By comparing the areas of these two regions, show that

$$\frac{A(x+h) - A(x)}{h} \approx \sin x$$

- (f) Use part (e) to give an intuitive explanation for the result of part (c).
- 3. (a) Draw the graph of the function $f(x) = \cos(x^2)$ in the viewing rectangle [0, 2] by [-1.25, 1.25].
 - (b) If we define a new function g by

$$g(x) = \int_0^x \cos(t^2) \, dt$$

then g(x) is the area under the graph of f from 0 to x [until f(x) becomes negative, at which point g(x) becomes a difference of areas]. Use part (a) to determine the value of x at which g(x) starts to decrease. [Unlike the integral in Problem 2, it is impossible to evaluate the integral defining g to obtain an explicit expression for g(x).]

- (c) Use the integration command on your calculator or computer to estimate g(0.2), g(0.4), g(0.6), ..., g(1.8), g(2). Then use these values to sketch a graph of g.
- (d) Use your graph of g from part (c) to sketch the graph of g' using the interpretation of g'(x) as the slope of a tangent line. How does the graph of g' compare with the graph of f?
- **4.** Suppose f is a continuous function on the interval [a, b] and we define a new function g by the equation

$$g(x) = \int_{a}^{x} f(t) \, dt$$

Based on your results in Problems 1–3, conjecture an expression for g'(x).
